

eFloStop

Automatic leak protection valve
for indoor hot water cylinders

DESCRIPTION

The AVG eFloStop is a smart valve that automatically shuts-off the mains water supply to a hot water cylinder if a water leak is detected.

Specifically designed for Australian homes and businesses, the eFloStop detects early signs of a water leak using a contact probe sensor. LED lights and audible alarm alerts user of a leak, and the electrically operated ball valve instantly closes to limit any potential damage from occurring.

The 15mm size and compression fittings makes it ideal for hot water cylinder systems. The 1m sensor cord, any installation orientation and built-in battery makes it versatile for installation. An optional power supply is included so the backup batteries don't need replacing.

For plumbing safety and ease of installation, the eFloStop is an excellent choice for plumbing professionals.

RELEASE DATE

April 2025

KEY FEATURES

- **Peace of Mind:** Automatic leak detection with contact leak sensor and audible alarm
- **Flood protection:** Electronic ball valves shuts-off water supply to limit potential leak damage
- **Easy Installation:** Quick install on indoor hot water cylinders
- **Versatile:** Install in any orientation, up to 1m away from the cylinder tray.
